                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          //dev_stage="pool of 9 week and 12 week"
//dev_stage="pool of 9 week and 12 week"
//dev_stages="pool of coli strain DH5 alpha"
//note="Organ: brain: Vector: pAWP10; cDNA was generated
from cytoplasmic RNA using a mixture of random DNA
hexamers and oligo(dT). From this pool of cDNA, human
chromosome 7-enriched cDNA was isolated by direct cDNA
selection using chromosome 7 genomic DNA (cosmids)... The
resulting direct-selected cDNA was cloned into a plasmid
vector using a non-directional uracil DNA glycosylase (UDG
)-mediated cloning strategy."

Institut fuer Molekulare Genetik, Berlin). cDNAs for EST analysis were selected following oligonucleotide hybridization fingerprinting of arrayed clones from zebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries. Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing In some cases multiple members of the same cluster were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota: Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

/lab_host="E. coli strain DH5 alpha"
/note="brain" Vector: pAMP10; cDNA was generated
from cytoplasmic RNA using a mixture of random DNA
hexamers and oligo(dT). From this pool of cDNA, human
chromosome 7-enriched cDNA was isolated by direct cDNA
selection using chromosome 7 genomic DNA (cosmids). The
resulting direct-selected cDNA was cloned into a plasmid
vector using a non-directional uracil DNA glycosylase (UDC
)-mediated cloning strategy."

                                                                                                                             NOTE: This is a 'working draft' sequence. It currently consists of 12 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              rCysAsnGluProLeuThrThrAsnAsnValAsnLysMetLeuLeuIleAspTyrLy 123
                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences of 444 movel human proteins. These were isolated from expressed sequences tags (ESTs). They can be used to stimulate cell growth, to regulate haematopolesis e.g. to treat aplastic anaemia, to help tissue regrowth e.g. in burn treatment, to regulate the immune system e.g. to treat multiple solarosis, to regulate activin or inhibin e.g. to treat infertility, to regulate haemostasis or thrombolysis e.g. to treat stroke and cancer, to screen for drugs, to treat inflammatory conditions e.g. rheumatoid arthritis, and to treat nervous system disorders e.g. parkinson's disease. The present sequence is a coding sequence of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 83

```
The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample comprising genes selected from (I). The method is useful for examining the ischaemic condition (e.g. compressive ischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB19912, encoding the protein sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes are used as an indicator when screening for ischaemic condition-improving represent PCR primers for a mouse ischaemic condition improving represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                    Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                            Ishii Y;

                                                                                                                                                                                                                                                                                                                                                                                  The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGIT6-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               LeuThrArgGlnProAlaProLeuSerGlnLysGlnArgSerPheValThrPheArgGly

Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin domain. The plexin polynucleotides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polynucleotides and polypeptides are useful for generating compounds (e.g. plaxin-specific binding agents or antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             neurodegenerative disease), or diseases or disorders involving aberrant fimune regulation (e.g. autoimmune diseases such as lupus, inflammatory bowel disease or Diabetes Type I), or immunosuppressive diseases such as multiple sclerosas or rheumatoria arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    in polynucleotides and polypeptides, useful in diagnosis, and in producing compounds for treating diseases involving cell growth (e.g. cancer) or immune regulation (e.g.

```

This invention describes a nucleic acid (1) with differential expression between tumour and normal cells and which has cytostatic activity. (1) work as modulators of Ras activity by inducing expression of tumour suppressor genes. (1), and polypeptides encoded by them, are useful as targets for diagnosis or therapy and in screening to determine the effects of an active compound (potential pharmaceutical) on a cell line, particularly for diagnosis and treatment of tumors, especially by modulating expression of (1) (by gene therapy, antisense RNA or ribozyme methods) or by modulating the amount and/or location of (1)-encoded onlypeptides (by administration of the polypeptide or its activator, antibody (optionally as a conjugate) or inhibitor). The method allows identification of many class II tumour suppressor genes (i.e. genes that ARB1492-AARB2376 represent the human and rat derived nucleic acid fragments described in the method of the invention.

The sequence encodes Human Plexin-B2. Plexins are large transmembrane proteins whose extracellular domain shares homology with Scatter factor receptors and contain an approximately 500 amino acid Semaphorin Gomain. The plexin polynuclectides and polypeptides, and plexin-specific binding agents are useful in diagnosis, therapy and in the biopharmaceutical industry. In particular, the plexin polynuclectides and polypeptides are useful for generating compounds (e.g. plexin-specific binding agents or antibodies) for treating or diagnosing a disease or disorder involving aberrant cell growth (e.g. hyperplasia, neoplasia, cancer or neurodegenerative disease), or diseases or disorders involving aberrant bowel disease or Diabetes Type I), or immunosuppressive diseases such as lupus, inflammatory bowel disease or Diabetes Type I), or immunosuppressive diseases such as multiple sclerosis or rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ArgGlyGluProAlaGluGlyPheAsnHisLeuValValAspGluArgThrGlyHisIle
